# JWS signed Voucher Artifacts for Bootstrapping Protocols

---

## Abstract

This document introduces a variant of the RFC8366 voucher artifact in which CMS is replaced by the JSON Object Signing and Encryption (JOSE) mechanism described in RFC7515. This supports deployments in which JOSE is preferred over CMS. In addition to specifying the format, the "application/voucher-jws+json" media type is registered and examples are provided.

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on 18 July 2025.

## 1. Introduction

This document provides cryptographic signing of voucher data in form of JSON Web Signature (JWS) [RFC7515] and the media type `application/voucher-jws+json` to identify the voucher format. The encoding specified in this document is used by [I-D.ietf-anima-brski-prm] and may be more handy for use cases already using Javascript Object Signing and Encryption (JOSE).

This is an extension to "A Voucher Artifact for Bootstrapping Protocols" [[I-D.ietf-anima-rfc8366bis](#)] in which the YANG data model is used by "Bootstrapping Remote Secure Key Infrastructure (BRSKI)" [[RFC8995](#)] and "Secure Zero Touch Provisioning (SZTP)" [[RFC8572](#)] to transfer ownership of a device from a manufacturer to a new owner (customer or operational domain). That document provides a serialization of the voucher data to JSON [[RFC8259](#)] with cryptographic signing according to the Cryptographic Message Syntax (CMS) [[RFC5652](#)].

This document is similar to [[I-D.ietf-anima-constrained-voucher](#)], which provides cryptographic signing according to COSE [[RFC8812](#)]. These documents do not change nor extend the YANG definitions of [[I-D.ietf-anima-rfc8366bis](#)].

With the availability of different voucher formats, it is up to an industry-specific application statement to decide which format is to be used. The associated media types are used to distinguish different voucher formats.

## 2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in BCP 14 [[RFC2119](#)] [[RFC8174](#)] when, and only when, they appear in all capitals, as shown here.

This document uses the following terms:

**JSON Voucher Data:** An unsigned JSON representation of the voucher data.

**JWS Voucher:** A JWS structure signing the JSON Voucher Data.

**Voucher:** A short form for voucher artifact and refers to the signed statement from a Manufacturer Authorized Signing Authority (MASA) service that indicates to a Pledge the cryptographic identity of the domain it should trust, per [[I-D.ietf-anima-rfc8366bis](#)].

**Voucher Data:** The raw (serialized) representation of the `ietf-voucher` YANG module without any enclosing signature, per [[I-D.ietf-anima-rfc8366bis](#)].

**MASA (Manufacturer Authorized Signing Authority):** The entity that, for the purpose of this document, issues and signs the vouchers for the manufacturer's pledges. In some onboarding protocols, the MASA may have an Internet presence and be integral to the onboarding process, whereas in other protocols the MASA may be an offline service that has no active role in the onboarding process, per [[I-D.ietf-anima-rfc8366bis](#)].

**Pledge:** The prospective component attempting to find and securely join a domain. When shipped or in factory reset mode, it only trusts authorized representatives of the manufacturer, per [[I-D.ietf-anima-rfc8366bis](#)].

**Registrar:** A representative of the domain that is configured, perhaps autonomically, to decide whether a new device is allowed to join the domain, per [[I-D.ietf-anima-rfc8366bis](#)].

This document uses the following encoding notations:

BASE64URL(OCTETS): Denotes the base64url encoding of OCTETS, per [Section 2](#) of [\[RFC7515\]](#).

UTF8(String): Denotes the octets of the UTF-8 [\[RFC3629\]](#) representation of String, per [Section 1](#) of [\[RFC7515\]](#).

### 3. Voucher Artifact with JSON Web Signature

JWS voucher artifacts MUST use the "General JWS JSON Serialization Syntax" defined in [Section 7.2.1](#) of [\[RFC7515\]](#). This syntax supports multiple signatures as already supported by [\[RFC8366\]](#) for CMS-signed vouchers. The following figure summarizes the serialization of JWS voucher artifacts:

```
{
  "payload": BASE64URL(UTF8(JSON Voucher Data)),
  "signatures": [
    {
      "protected": BASE64URL(UTF8(JWS Protected Header)),
      "signature": BASE64URL(JWS Signature)
    }
  ]
}
```

*Figure 1: Voucher Representation in General JWS JSON Serialization Syntax (JWS Voucher)*

The JSON Voucher Data MUST be UTF-8 encoded to become the octet-based JWS Payload defined in [\[RFC7515\]](#). The JWS Payload is further base64url-encoded to become the string value of the payload member as described in [Section 3.2](#) of [\[RFC7515\]](#). The octets of the UTF-8 representation of the JWS Protected Header are base64url-encoded to become the string value of the protected member. The generated JWS Signature is base64url-encoded to become the string value of the signature member.

#### 3.1. JSON Voucher Data

The JSON Voucher Data is an unsigned JSON document [\[RFC8259\]](#) that conforms with the data model described by the ietf-voucher YANG module [\[RFC7950\]](#) defined in [Section 7.3](#) of [\[I-D.ietf-anima-rfc8366bis\]](#) and is encoded using the rules defined in [\[RFC7951\]](#). The following figure provides an example of JSON Voucher Data:

```
{
  "ietf-voucher:voucher": {
    "assertion": "logged",
    "serial-number": "0123456789",
    "nonce": "5742698422680472",
    "created-on": "2022-07-08T03:01:24.618Z",
    "pinned-domain-cert": "base64encodedvalue=="
  }
}
```

Figure 2: JSON Voucher Data Example

### 3.2. JWS Protected Header

The JWS Protected Header defined in [RFC7515] uses the standard header parameters alg, typ, and x5c:

- The alg parameter MUST contain the algorithm type (e.g., ES256) used to create the signature as defined in Section 4.1.1 of [RFC7515].
- The typ parameter is optional and used when more than one kind of object could be present in an application data structure as described in Section 4.1.9 of [RFC7515]. If present, the typ parameter MUST contain the value voucher-jws+json.
- If X.509 (PKIX) certificates [RFC5280] are used, the x5c parameter MUST contain the base64-encoded (not base64url-encoded) X.509 v3 (DER) certificate as defined in Section 4.1.6 of [RFC7515] and MUST also contain the certificate chain.

Implementation Note: base64-encoded values, in contrast to base64url-encoded values, may contain slashes (/). JSON [RFC8259] optionally allows escaping these with backslashes (\\). Hence, depending on the JSON parser/serializer implementation used, they may or may not be included. JWS Voucher parsers MUST be prepared accordingly to extract certificates correctly.

To validate voucher signatures, all certificates of the certificate chain are required up to the trust anchor. Note, to establish trust the trust anchor MUST be provided out-of-band up front.

The following figure gives an example of a JWS Protected Header:

```
{
  "alg": "ES256",
  "typ": "voucher-jws+json",
  "x5c": [
    "base64encodedvalue1==",
    "base64encodedvalue2=="
  ]
}
```

*Figure 3: JWS Protected Header Example*

### 3.3. JWS Signature

The JWS Signature is generated over the JWS Protected Header and the JWS Payload (= UTF-8 encoded JSON Voucher Data) as described in [Section 5.1](#) of [\[RFC7515\]](#).

## 4. Privacy Considerations

The Pledge-Voucher-Request (PVR) reveals the IDevID of the component (Pledge) that is in the process of bootstrapping.

A PVR is transported via HTTP-over-TLS. However, for the Pledge-to-Registrar TLS connection a Pledge provisionally accepts the Registrar server certificate during the TLS server authentication. Hence, it is subject to disclosure by a Dolev-Yao attacker (a "malicious messenger") [\[ON-PATH\]](#), as explained in [Section 10.2](#) of [\[RFC8995\]](#).

The use of a JWS header, with mentioned standard header parameters alg, typ, and x5c, brings no new privacy considerations next to [Section 10.2](#) of [\[RFC8995\]](#).

## 5. Security Considerations

The issues of how [\[I-D.ietf-anima-rfc8366bis\]](#) vouchers are used in a BRSKI system is addressed in [Section 11](#) of [\[RFC8995\]](#). This document does not change any of those issues, it just changes the signature technology used for voucher request and response artifacts.

[Section 9](#) of [\[RFC8572\]](#) deals with voucher use in Secure Zero Touch Provisioning (SZTP), for which this document also makes no changes to security.

## 6. IANA Considerations

### 6.1. Media-Type Registry

This section registers application/voucher-jws+json in the "Media Types" registry.

### 6.1.1. application/voucher-jws+json

```
Type name: application
Subtype name: voucher-jws+json
Required parameters: N/A
Optional parameters: N/A
Encoding considerations: JWS+JSON vouchers are JOSE objects
                        signed with one or multiple signers.
Security considerations: See section [Security Considerations]
Interoperability considerations: The format is designed to be
                                broadly interoperable.
Published specification: THIS RFC
Applications that use this media type: ANIMA, 6tisch, and other
                                zero-touch bootstrapping/provisioning solutions
Additional information:
    Magic number(s): N/A
    File extension(s): .vjj
    Macintosh file type code(s): N/A
Person & email address to contact for further information: IETF
    ANIMA WG
Intended usage: LIMITED
Restrictions on usage: N/A
Author: ANIMA WG
Change controller: IETF
Provisional registration? (standards tree only): NO
```

## 7. Acknowledgments

We would like to thank the various reviewers for their input, in particular Steffen Fries, Ingo Wenda, Esko Dijk and Toerless Eckert. Thanks for the supporting PoC implementations to Hong Rui Li and He Peng Jia.

## 8. Examples

These examples are folded according to the [\[RFC8792\]](#) Single Backslash rule.

### 8.1. Example Pledge-Voucher-Request (PVR)

The following is an example of a Pledge-Voucher-Request (PVR) as JWS Voucher artifact, which would be sent from a Pledge to the Registrar:

```
{
